Telekom Srbija

Wireless communications standards evolution

Evolution conducted by International standardization organization 3GPP

Telekom Srbija

5G main benefits

Faster speed - up to 10Gbps per device
10 to 100 times faster than 4G cellular
connections

Lower latency - Significantly reduced
up to 1ms end-to-end

Greater capacity - significantly greater number
of connected devices

5G technology promises to revolutionize healthcare

Healthcare centers need 5G in digital transformation

*Support for fast,
secure, error-free
real-time
Monitoring Systems*

*•Expansion of
Telemedicine*

*Fast Transmission
of Large Files*

*•Augmented
Reality, Virtual
Reality & Spatial
Computing*

5G Mobile Technology as Game Changer In Healthcare

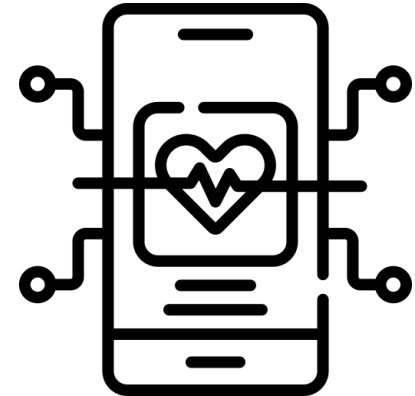

Fields of Medical Care that get most benefits of 5G technology

Telehealth
throughput
latency

Robotic Surgery
private networks

**Internet of
Medical Things**
capacity

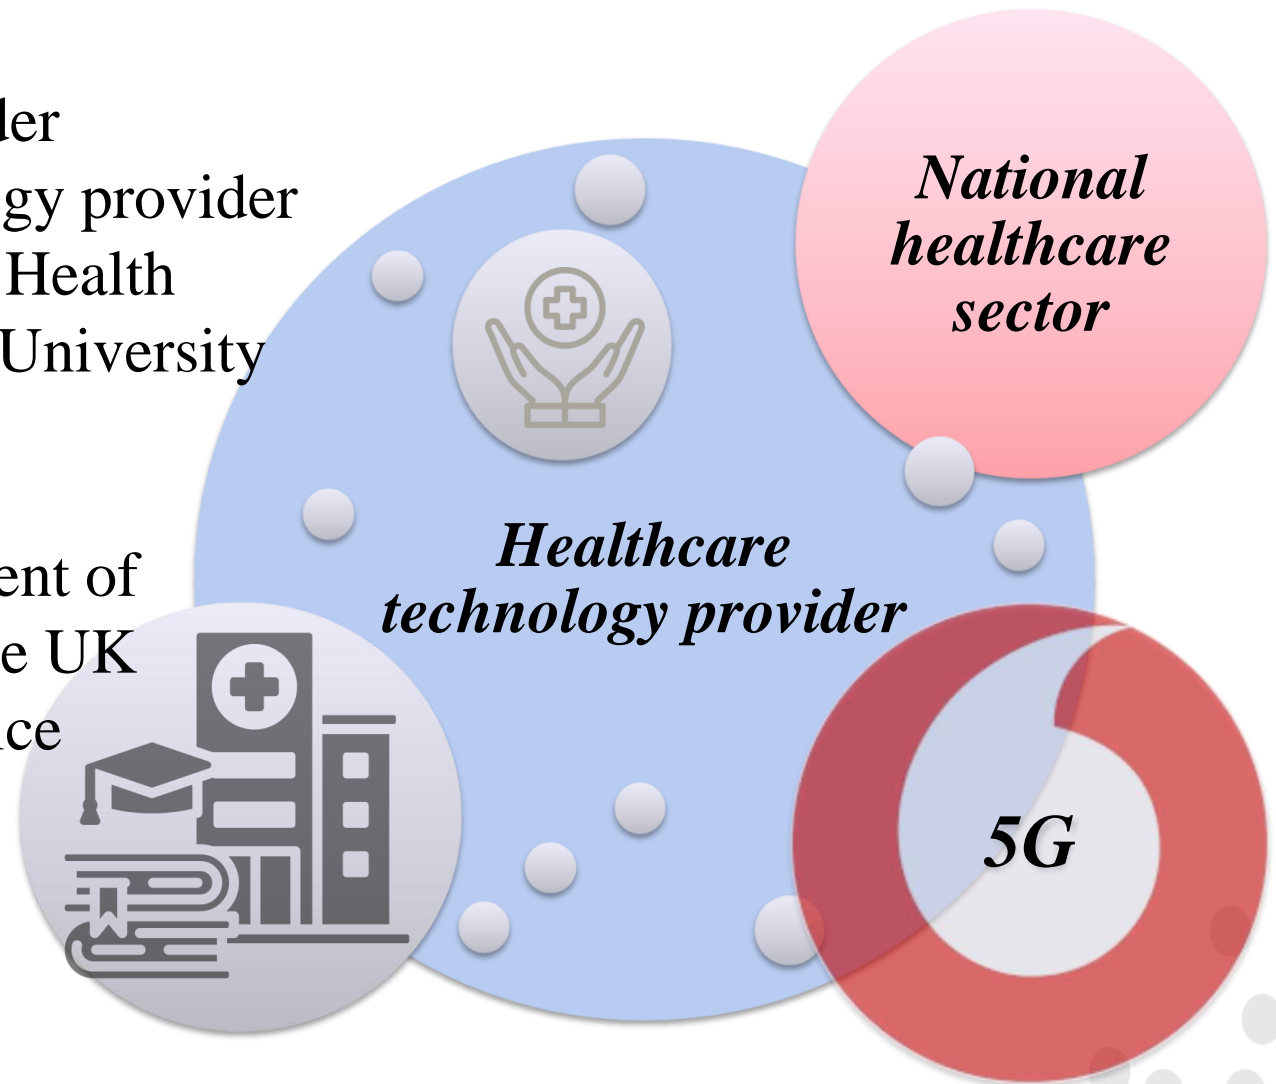

Telehealth ecosystem supported by 5G

Pilot in 2021. in UK

- Vodafone 5G provider
- Healthcare technology provider
- UK Department for Health
- Teams from Health University

Case

Diagnosis and treatment of
bowl cancer across the UK
National Health Service

Private 5G networks

- dedicated for a specific organization or location*

smooth and efficient operations

secure and reliable wireless connectivity

exclusive to a single user or organization

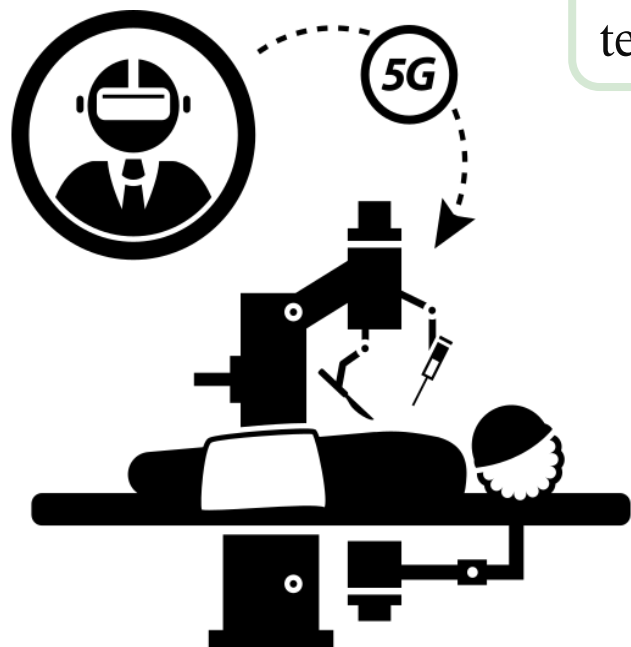

SAMSUNG

Telekom Srbija

Remote Surgeries

The control deck - controller to command a telemanipulator located in a remote location.

Telemanipulators - remote manipulators - robotic arms consisting of electronic, hydraulic, or mechanical components that allow movements from a remote location.

Technical requirements for successful remote surgeries

• *sustainable high-speed performance*

• *minimum latency in milliseconds*

• *reliable network connection*

• *security of hardware and software*

• *stable power grid/electricity supply*

5G assisted telesurgeries studies

*2018 Fujian China
remote hepatectomy in a porcine model
Kangduo robotic surgery system
average latency less than 150 ms*

*2019 Barcelona Spain
laparoscopic access with a
medial-to-lateral approach
Vodafone 5G*

*2019 Munich Germany
Video streaming rate 7.2–8 Mbps
robotic control command rate 19.2–57.6 Kb/s
latency 2–60 ms*

Successful 5G usage in Remote Surgeries

19 Mar 2019

China

China Mobile & Huawei 5G

deep brain stimulation (DBS) implant

The first remote surgery on a human using 5G technology

19 Feb 2023

China

gallbladder remove

*orchestrated from more than
4,500km away*

SEPTEMBER 20TH, 2023

Bari Polyclinic in Italy

laser corneal surgery

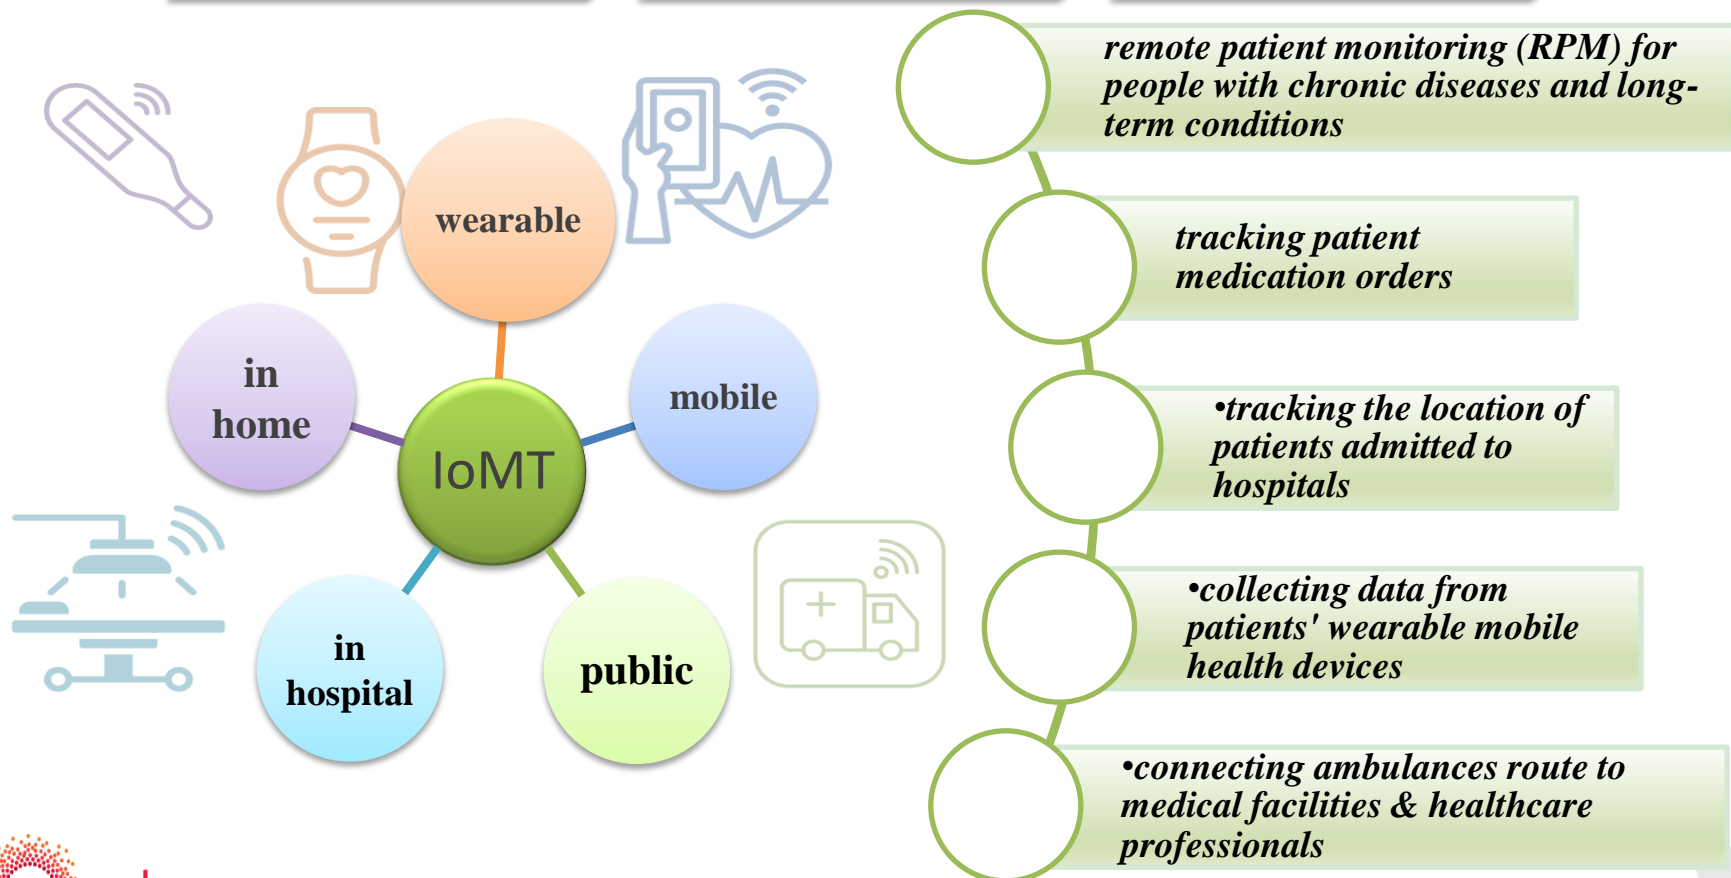

TIM Group 5G infrastructure

latency less than 50ms

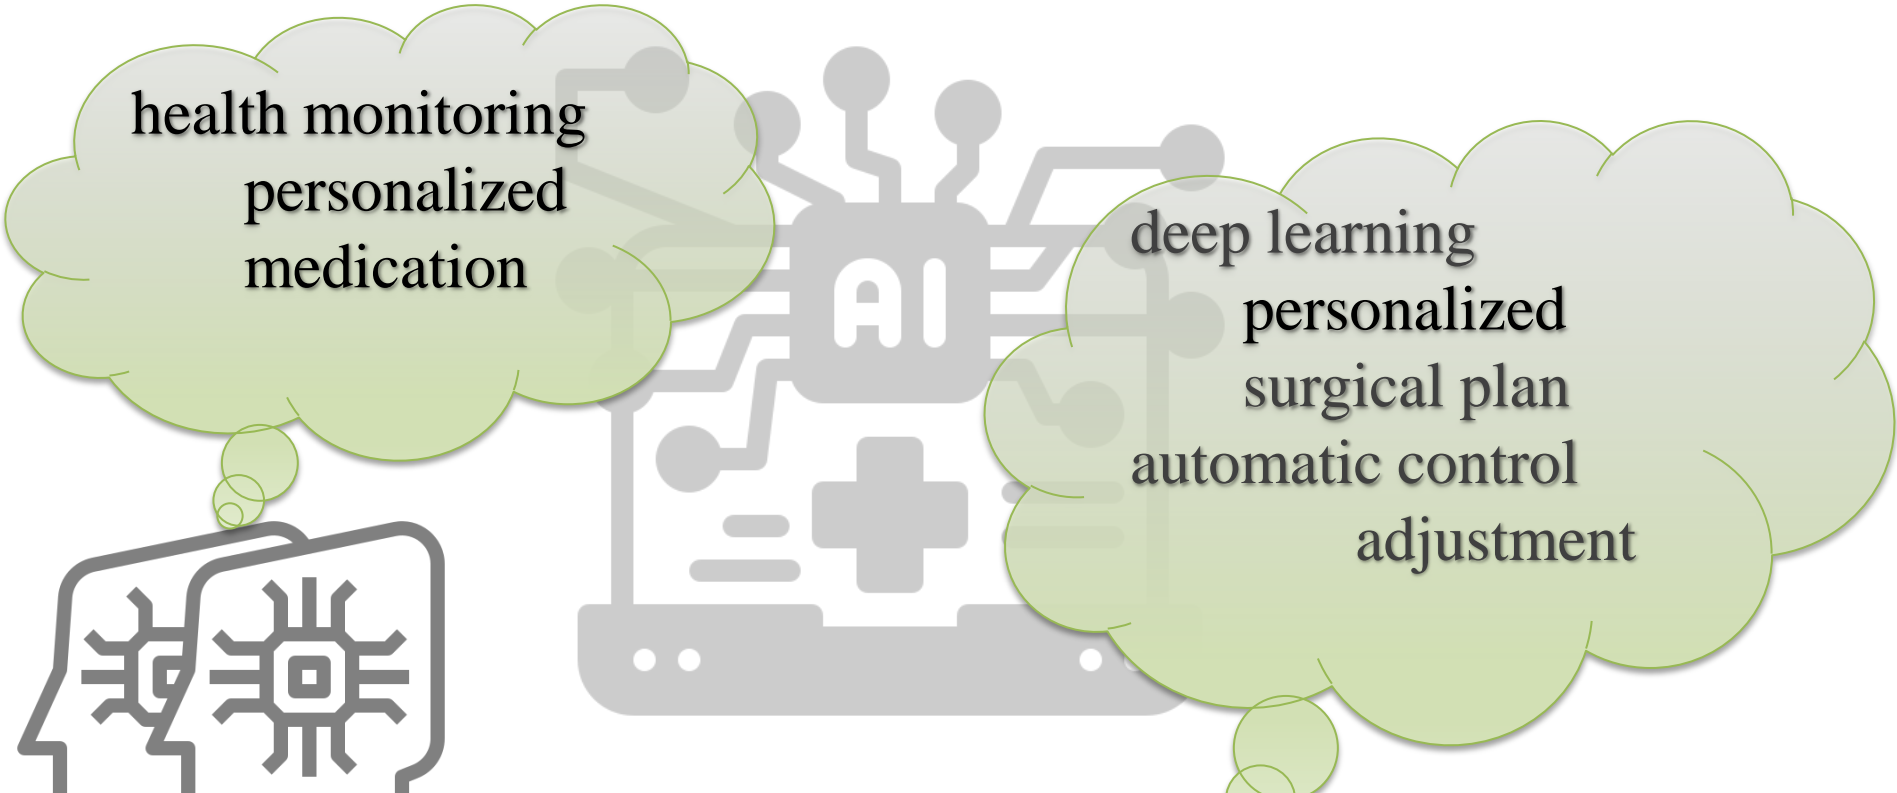

*5G radio modules inside surgeon's
room and in the operating theatre*

Internet of medical things (IoMT) - healthcare IoT

Artificial intelligence and digital twin in medicine

health monitoring
personalized
medication

deep learning
personalized
surgical plan
automatic control
adjustment

Digital twin is a digital representation of real-world entities or systems, creating virtual models of physical entities in a digital way that can describe the process of “symbiosis” between physical objects and their dynamic processes throughout their lifecycle.

Possible challenges and limitations

- advancement in telecommunications
- use of blockchain technology
- virtual reality (VR) applications
- augmented reality (AR) applications

- regulatory variants across regions
- cyber security
- artificial intelligence (AI) system development
- costing

- new health ecosystem
- precision medicine in public health
- cloud healthcare platforms

Conclusion

evolved patient care

added years of good health

better quality of life
